Higher order Osserman pseudo-Riemannian manifolds of neutral signature (2, 2)

Cătălin Șterbeți

Abstract

In this paper we construct a family of pseudo-Riemannian metrics of neutral signature (2, 2) which leads to k -Osserman manifolds for all k admissible. For these manifolds the generalized Jacobi operator is 2-nilpotent. Conditions for locally symmetry on the considered manifolds are established.

Mathematics Subject Classification: 53A45, 53C35, 53C50.

Key words: generalized Jacobi operator, locally symmetric.

Three-level tree structure:

52 Convex and discrete geometry

53 Differential geometry

53A Classical differential geometry

53A04 Curves in Euclidean space

53A45 Vector and tensor analysis

53B Local differential geometry

Usage so far (browsing, search, classification, ...):

Old implementation (plain TeX):

`\MajorSub 53-++\SubText Differential geometry`

`\SeeFor{For differential topology, see \SbjNo 57Rxx.}`

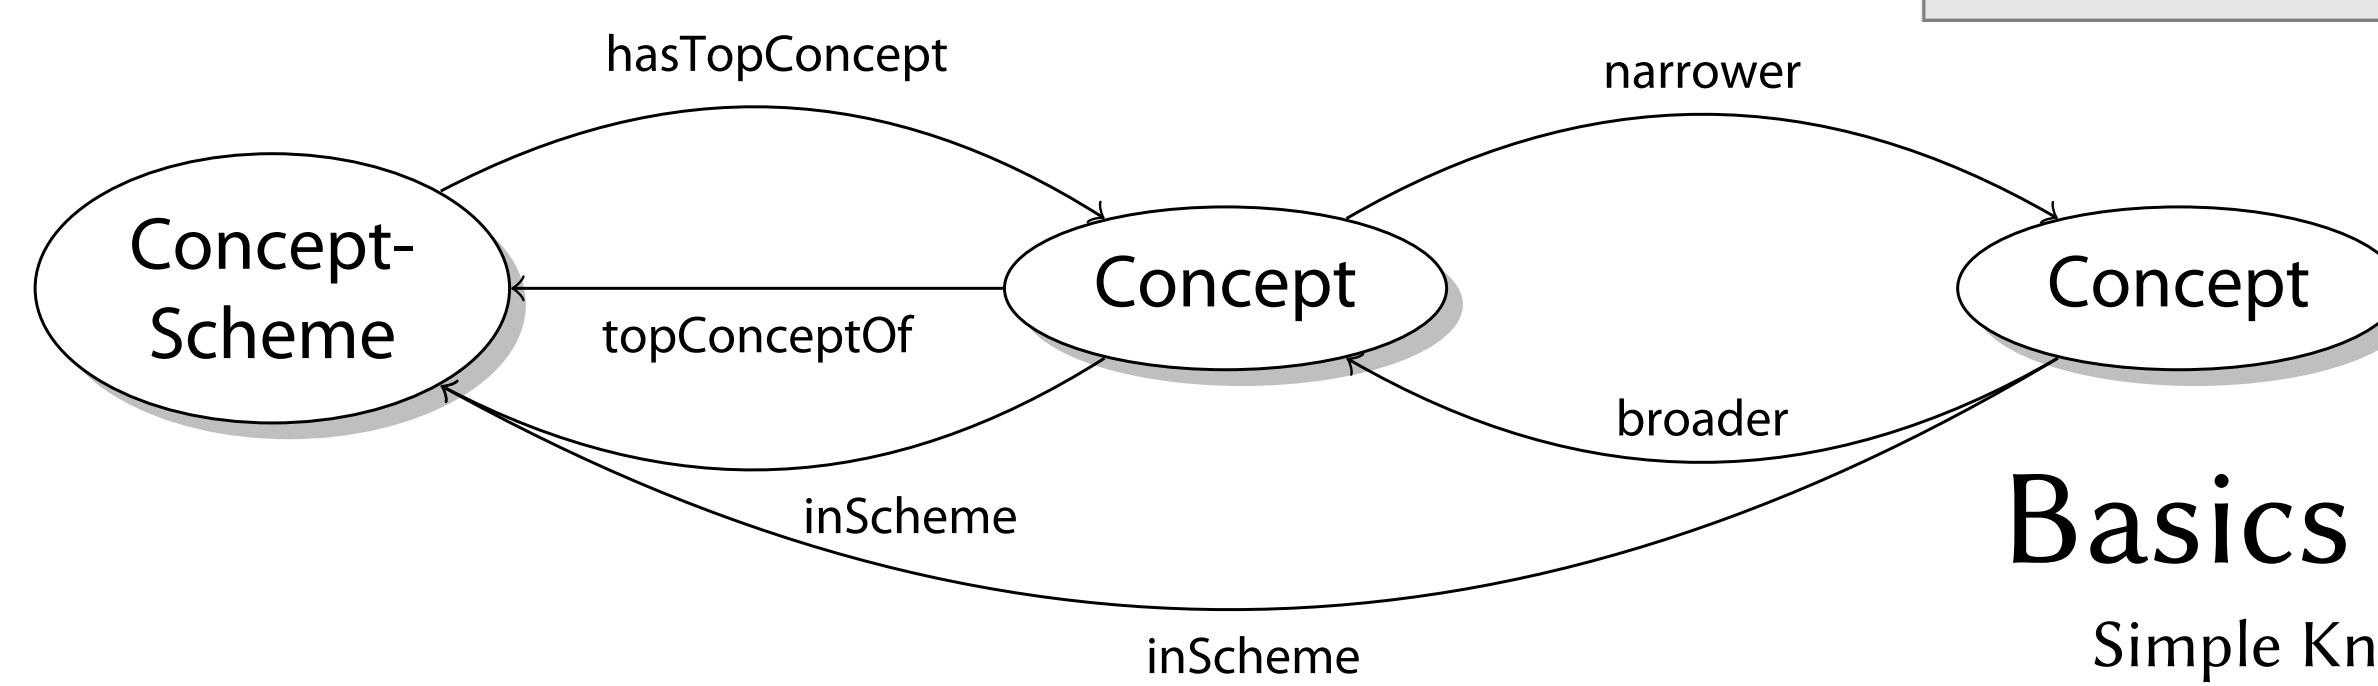

For foundational questions of differentiable manifolds, see `\SbjNo 58Axx}`

`\SecndLv1 53Axx\SubText Classical differential geometry`

`\ThirdLv1 53A45\SubText Vector and tensor analysis`

Redesign Requirements:

1. facilitate use and reuse
2. facilitate maintenance
3. enable knowledge workers and service developers to adapt and extend the MSC
4. allow end users to explore connections to related subjects

Basics of SKOS Core

Simple Knowledge Organization System

`<http://msc2010.org/resources/MS/2010/53A45>`

`msc2010:53A45` a `skos:Concept` ;

`skos:inScheme` `msc2010:` ;

`skos:broader` `msc2010:53Axx` ;

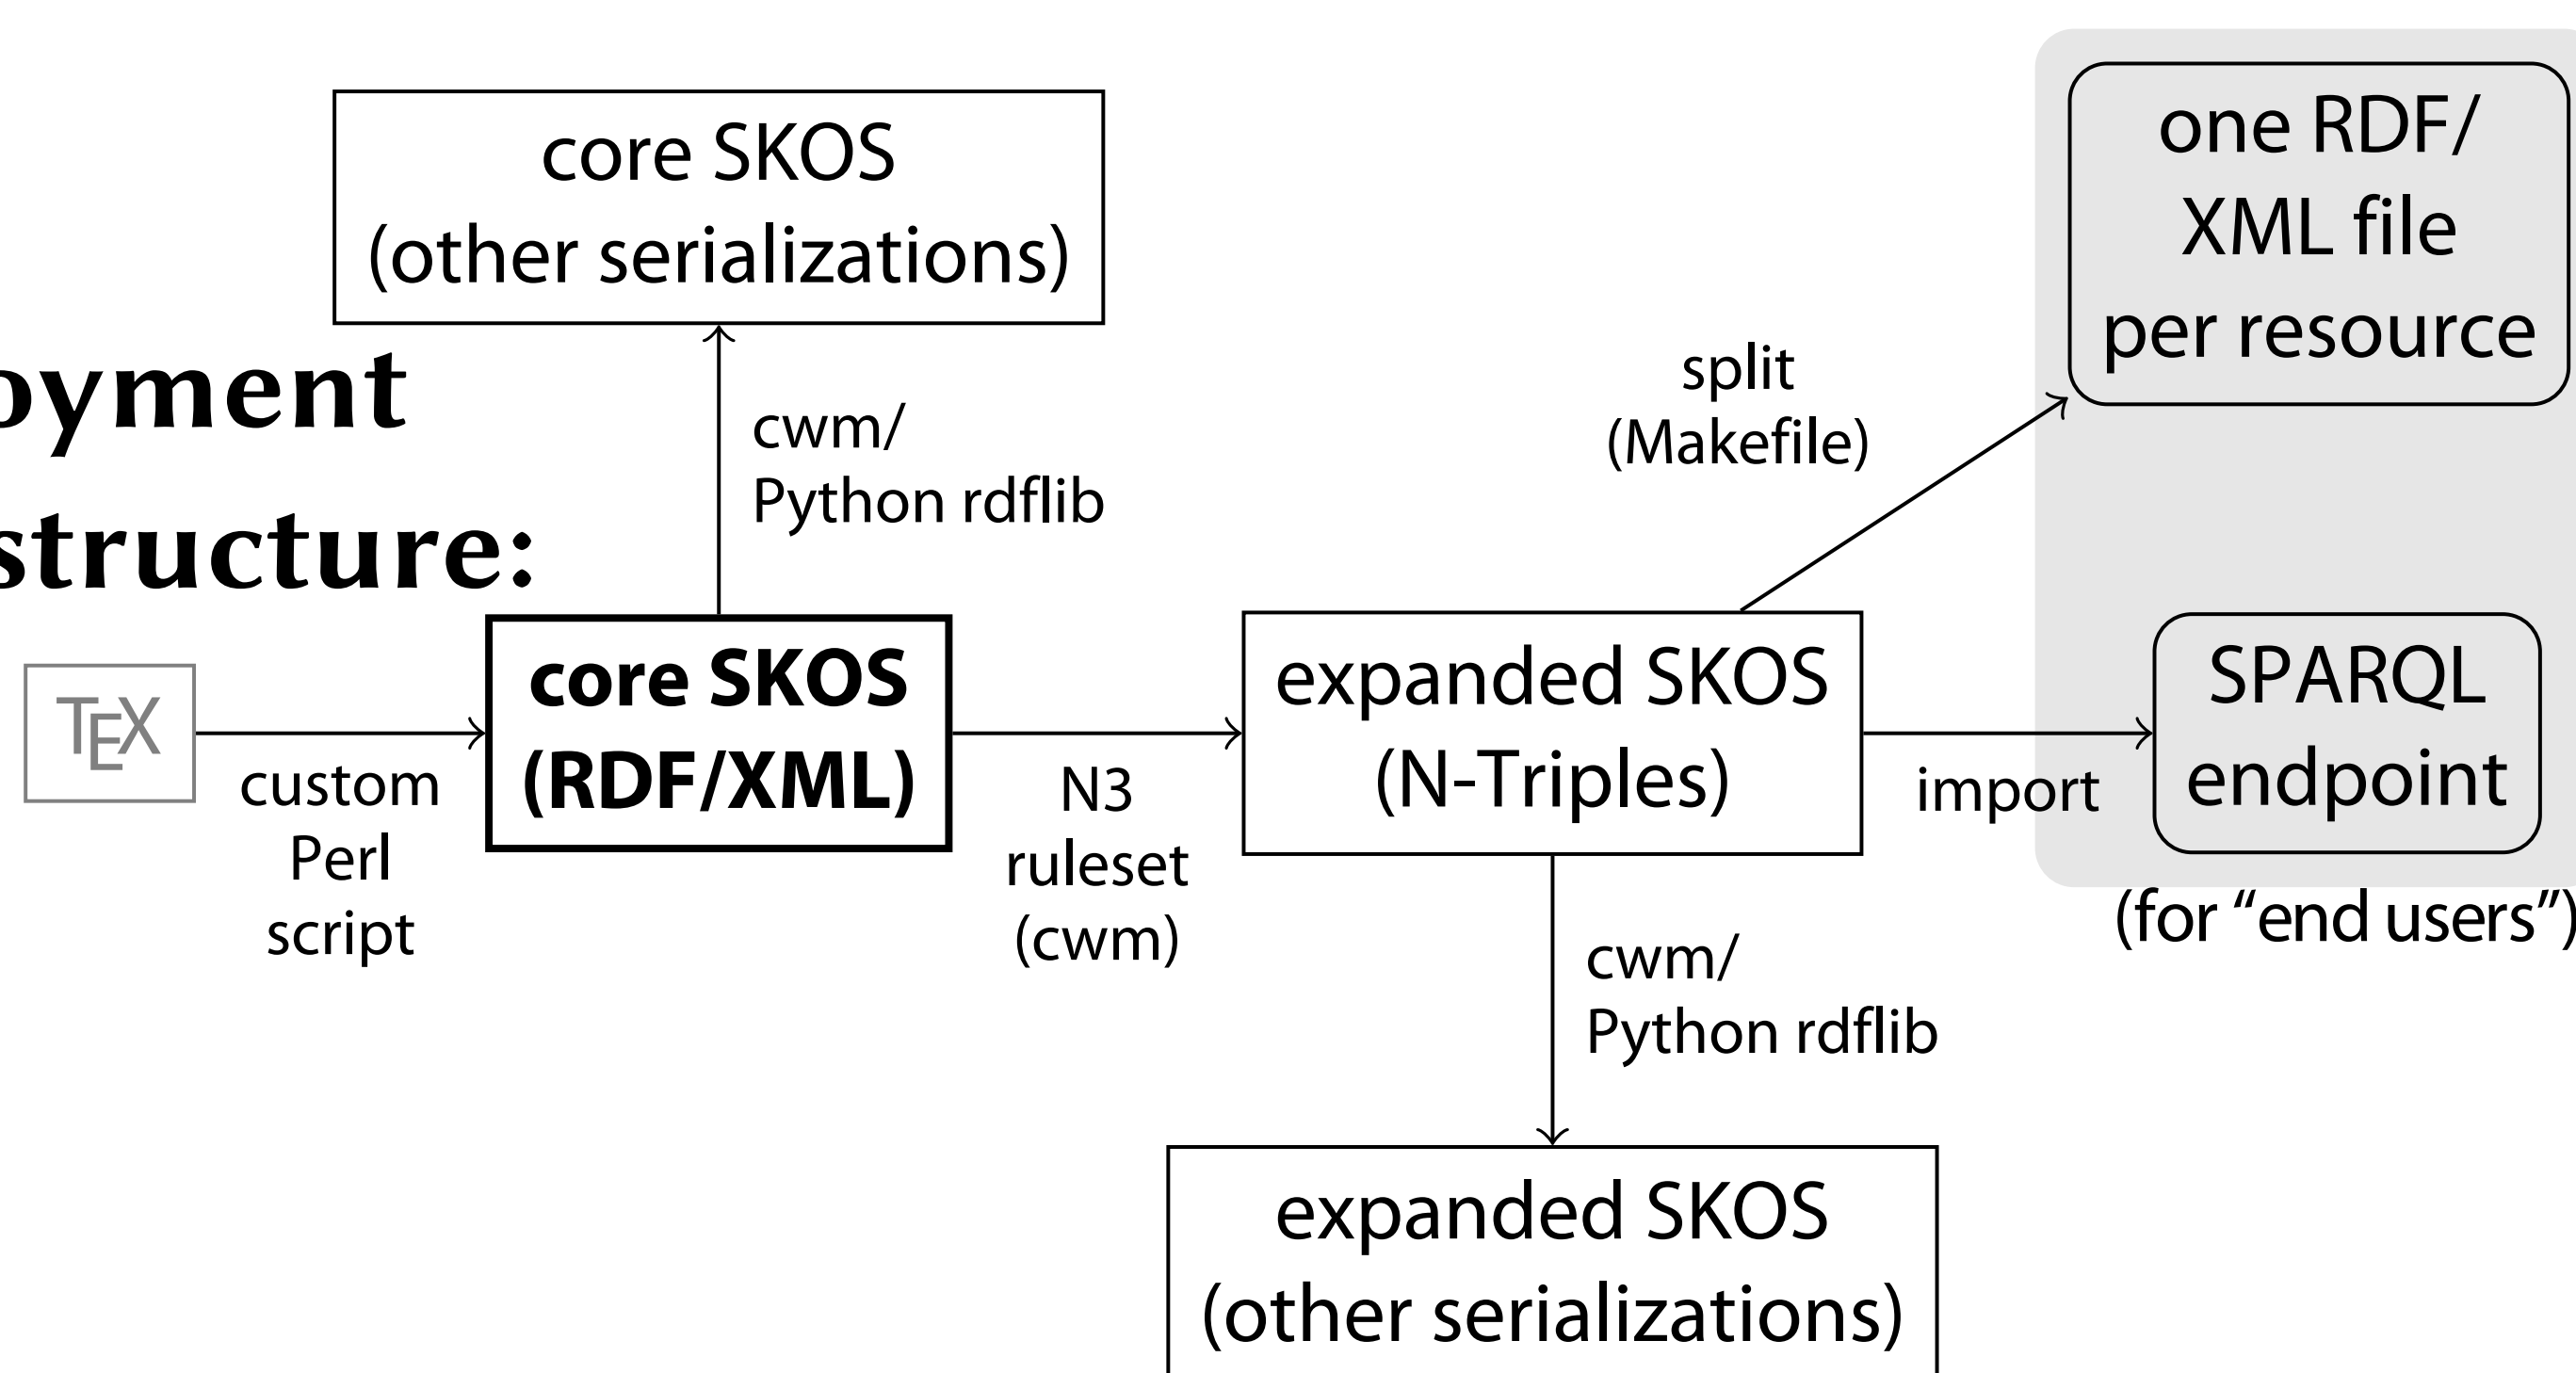

`skos:prefLabel` "Vector and tensor analysis"@en,
"向量与张量分析"@zh ;

`skos:notation` "53A45"^^`mscsmpl:MSCNotation` .

Further SKOS Features used:

- `<MathML>` in labels
- links across MSC versions to reflect changes and aid migration
- links to other concept schemes
- collections (e.g. "historical topics")

Deployment Infrastructure:

In Use: PlanetMath's "browse by subject":

`PREFIX msc: <http://msc2010.org/resources/MS/2010/>`

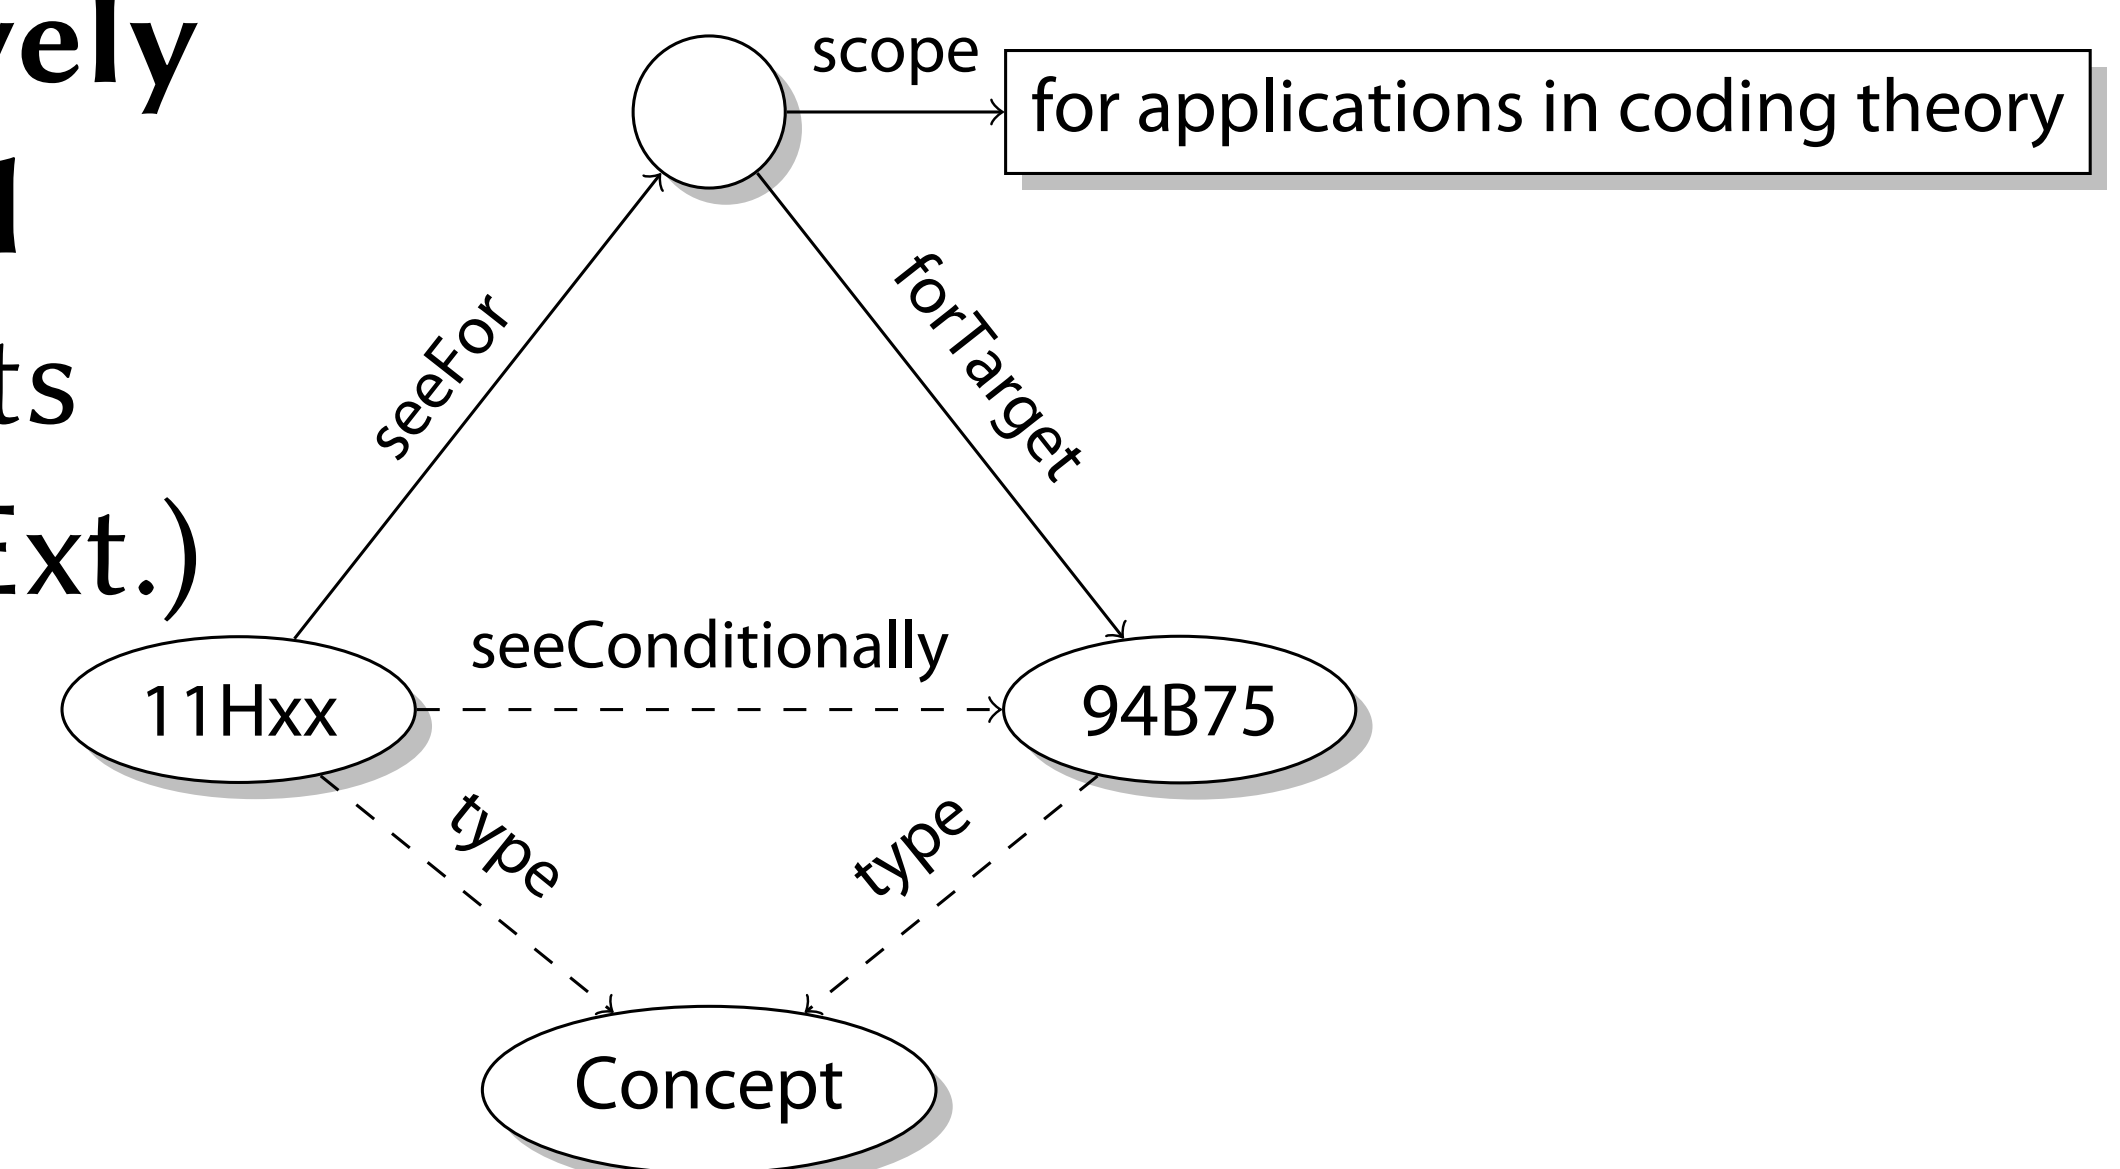

`PREFIX skos: <http://www.w3.org/2004/02/skos/core#>`

`PREFIX dct: <http://purl.org/dc/terms/>`

```
SELECT DISTINCT ?subclass ?notation ?label COUNT(?article) WHERE {
  msc:53Axx skos:narrower ?subclass . # get subclasses; then, for each subclass:
  ?subclass skos:notation ?notation ; # get the MSC class number
  skos:prefLabel ?label . # get the preferred label
  OPTIONAL { ?article dct:subject ?subclass } # get classified articles (if any)
  FILTER langMatches(lang(?label), "en") # only English labels
}
```

`GROUP BY ?subclass ?notation ?label # grouping just needed for COUNT() to work`

Partitively Related Concepts (SKOS Ext.)

Next Steps:

1. Community building: official announcement by MR/Zentralblatt, and to Linked Data community
2. Improving retrieval: adding precise definitions of the MSC classes; adding index terms to classes; introducing a faceted structure (beyond collections)
3. Weaving the Web of Data: connect to DBpedia, OpenMath CDs, ACM Computing Classif., EuDML, ...

We enable fine-grained classification of mathematical resources smaller than articles (e.g. blog posts, tweets).
Effect: democratization of scientific publishing, towards networked science
